

Why Tier 3 failed — the strongest AP-1 “partners” are mostly motifs that resemble AP-1 itself

Astrocytes and Oligodendrocytes fill their strongest hits with AP-1 look-alikes on the LEFT — the same stretch of DNA matched by two similar motifs, not two factors binding together. Microglia is the exception: its top hits are distinct factors on the RIGHT (TEF, DBP, CEBPG — a PAR-bZIP/C-EBP signature), and it is the one cell type that recovers the paper's biology.

- top hit whose motif RESEMBLES AP-1 (< 0.7) — an artifact
- top hit that is a GENUINELY DISTINCT factor (≥ 0.7)
- the paper's expected lineage partner (scored in Figure 2)
- all other motifs
